8-97262166-0 8972621660 eccentric shaft plays an important role in the ISUZU 700P/4HK1. It is able to change the lift and opening time of the valves to optimise the engine's intake and exhaust efficiency. For example, at high speeds, the eccentric shaft increases valve opening, allowing more air to enter the cylinder and boosting power output. At low speeds, it can be adjusted appropriately to improve fuel economy. The precise operation of the eccentric shaft ensures that the engine can perform optimally under different working conditions, enhancing the vehicle's power and stability.
